

AN AI EXPERIMENT IN PLAYABLE IMAGINATION

Everything's Made Up (in Real Time) and the Points Don't Matter

An AI experiment building **1,000 Blank White Cards**

Matt builds production AI systems—and occasionally uses them to recover a favorite game from high school.

ABOUT ME

Builder, Teacher, Player

A production-focused background across AI strategy, data systems, engineering, and model deployment.

12+ yrs

DATA + AI LEADERSHIP

End-to-End

PRODUCT TO PRODUCTION

Builder + Teacher

MLOPS, LLMS, STRATEGY

- Builds AI products across product strategy, engineering, deployment, and operations.
- Co-author of **LLMs in Production**.
- Longtime improv and party-game hobbyist with a very specific missing deck.
- Adjunct professor teaching graduate-level LLM and AI systems.
- Works across startups, large technology companies, and public-sector teams.

The one game software cannot finish

WHAT MAKES IT SPECIAL

- Players write the cards.
- Every card can invent a new mechanic.
- The table keeps its favorites.
- The deck becomes a history of the group.

The rules do not exist until someone plays them.

ONE PHYSICAL COPY

My friend ran off with our deck—and years of shared jokes with it.

ONE SCATTERED GROUP

We now live in different states, but the game requires one table.

ONE SOFTWARE BLIND SPOT

No developer can pre-program rules players invent mid-game.

Success means the table is having fun

MOMENTUM

Keeps moving

PERSONALITY

Talks back

REPLAY VALUE

Worth keeping

- New cards become playable without breaking the rhythm of a turn.
- The agent turns rulings into entertainment with snarky commentary.
- Unexpected interpretations create stories instead of dead ends.
- Players keep the cards—and moments—they want to see again.

Me—and people like me

IMPROV HOBBYISTS

Players who enjoy surprise, collaboration, and making up the rules together.

SCATTERED GROUPS

Friends whose shared games and inside jokes now span cities, states, and time zones.

CREATIVE PLAYERS

People who value the story the table creates more than optimizing for a win.

They do not need another party game. They want **their** game back.

Solution: the game ships with a developer

You cannot hand-code rules that have not been invented yet—so an AI compiles each card as it enters play.

STEP 1

INVENT

A player writes any rule in plain language.

STEP 2

INTERPRET

The agent reads the card, live board, rules, and precedent.

STEP 3

COMPILE

Intent becomes a bounded, executable effect program.

STEP 4

PLAY

The engine applies it and broadcasts the new state.

Live demo: join → invent a card → play it → watch the game change.

1. Game system

THREE ROLES

- **Board:** shared multiplayer experience
- **Engine:** game physics
- **Agent:** new meaning

2. Card workflow

TWO PATHS

- **Old cards:** instant
- **New cards:** agents brew
- **Engine:** dry-run, then apply
- **Keepers:** future precedent

3. Agent team

FIVE STAGES

- **Intent:** meaning + persona
- **Planner:** mechanics
- **Coder:** executable effect
- **Validate / Repair**
- **Finalize:** ruling + table talk

What worked—and what comes next

PROVEN

Free-text cards can become live, bounded game behavior without putting AI at the center of play.

HARDEN

Add durable room and corpus storage, production scaling, and deeper operational observability.

EXPAND

Support camera proof, physical dares, richer spectator voting, and visible accessibility text.

The impossible part now works. The next step is making it durable—and even more human.

1000 BLANK WHITE CARDS

Everything's made up. The game keeps up.

A scattered friend group can keep inventing together
—and this time, no one can run off with the deck.
